

Digital Twin

for smart buildings and cities

June 7th, 2020

// State of the Art

Domotics & Home automation

Domestic management
Occupancy-aware system
Security & infotainment

Telecom & Data transfer

Broadband access
Smart car parking

Spatio-temporal flux monitoring

Traffic control
Crowd management

Visual 3D model

Building classification
GIS system
Volumetric & population densities

B.I.M.

Facility & space management

AR & VR

Immersive cultural experience

Business

Real-time analytics
Big data mining and analysis

Sensors

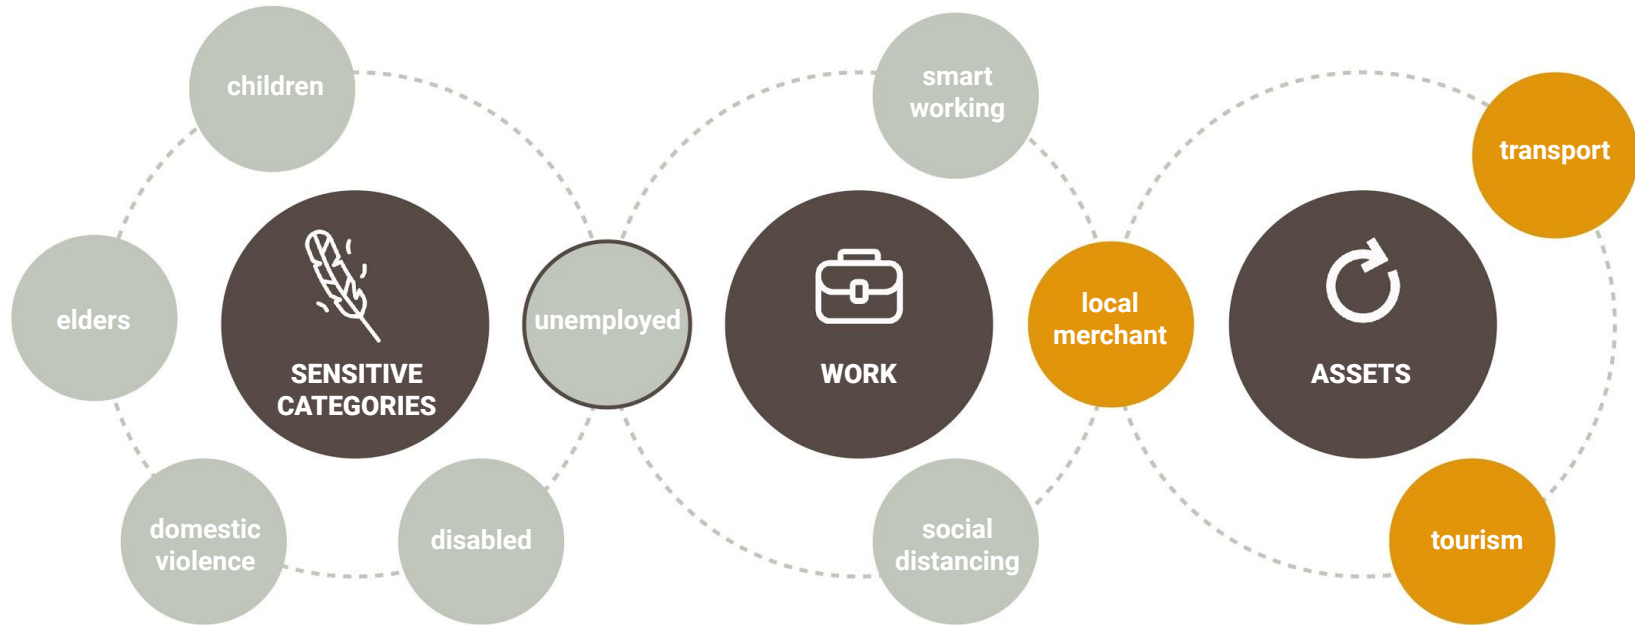

Environmental monitoring
Waste management
Smart roads

Emergency

Disaster response and recovery

// COVID-related issues

// Customer segments | needs | value

// CITIZEN //

stay safe

maintain usual habits

population density
information

crowd monitoring
information
recommendations

// LOCAL MERCHANT //

increase business
profit percentage

guarantee customers
safety

boost visibility

incentivized customers
through token reward
system

// TOURIST //

stay safe while
visiting

smart and safe trip
management

online queueing

crowding and queueing
forecast
city insights and statistics

// CITY MANAGER //

enforce health regulations

promote local business,
tourism and events

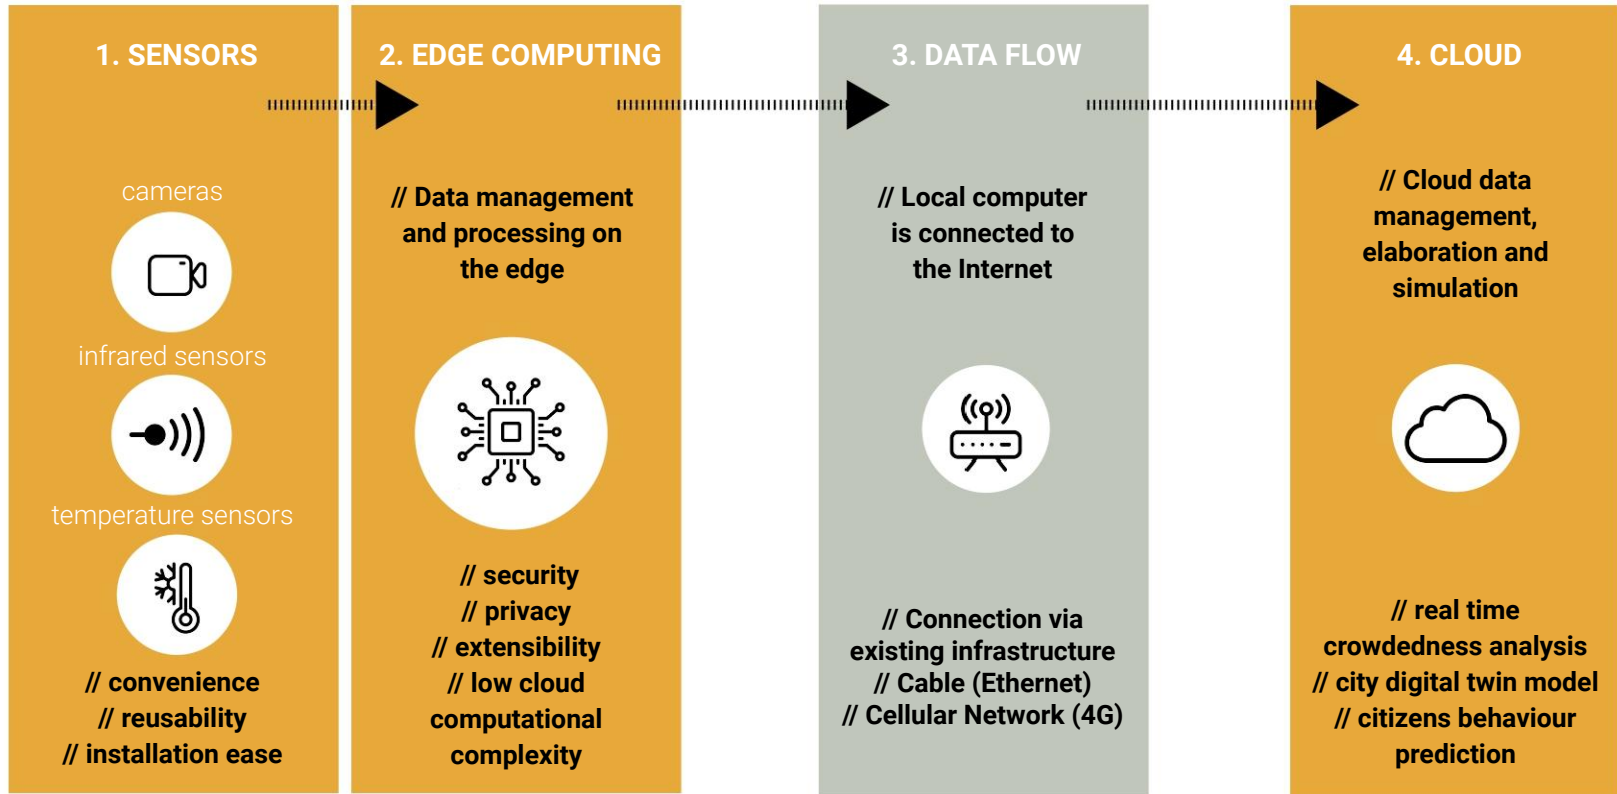

give feedback to public
administrators on rules
observance

enhanced services and
experience for citizens
and tourists
smart events scheduling

Mobile App

Dashboard

// Physical devices | Data flow

// Value proposition

tourist
citizen

"Become a tourist in your favorite city, take it Zen"

// Mobile app

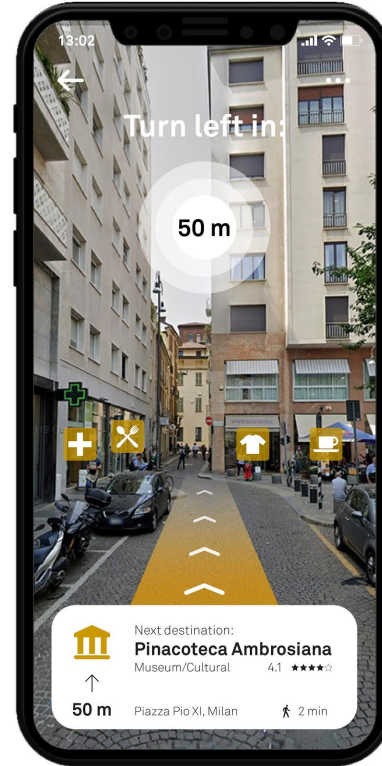

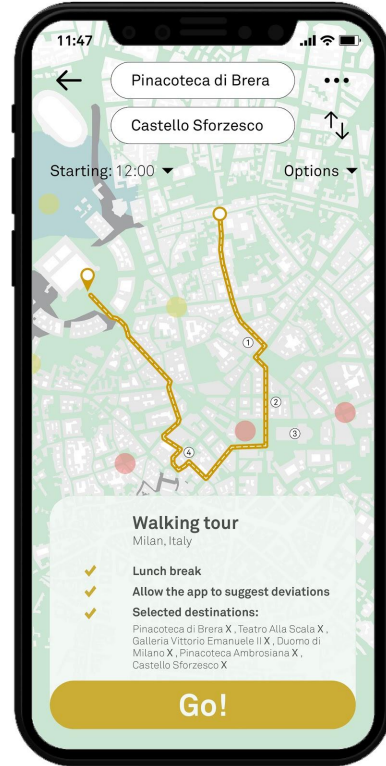

// Real-time information,
recommendations and
insights

// Smart Itinerary

// Promotions and
Advertising

// Reports and Reviews

// Gamification

// Dashboard for Public Administration

// Real time spatio-temporal
crowd monitoring

// Social distancing analysis

// Quality of Life monitoring

// Crowdedness prediction and
underused areas identification

// Key metrics

// Number of Users reached

Measured in terms of overall downloads and variation rate, it offers an indicator of how popular our solution is.

// Number of Shops in the Network

This metric provides information on how appreciated our solution is from the merchants point of view.

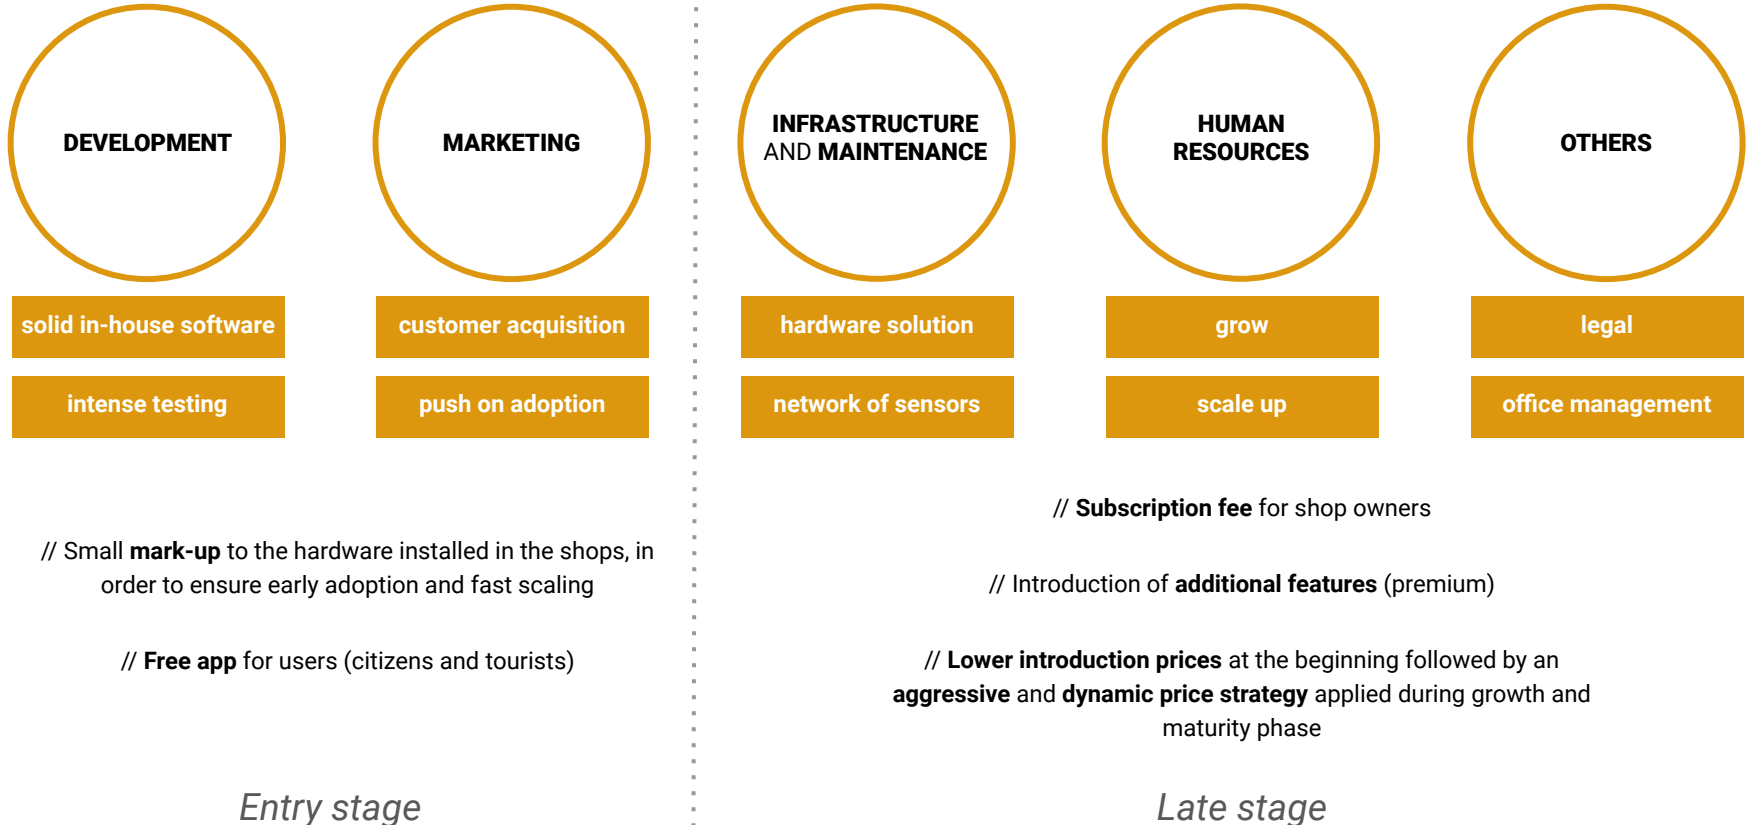

// Number of Interactions

This measures how active and involved is the community sustaining the platform.

// Cost structure | Revenue streams

// Interconnection | Health

"A patient-specific map of the city showing the health of its places in relation to the specific user's clinical conditions and preferences"

Sensors and Data Integration

- // Cameras for social distancing to avoid crowding, especially for sensitive categories (From **TouriZen**)
 - // Cameras' footage audio for noise pollution (From **TouriZen**)
 - // Temperature and humidity of shops for air quality (From **TouriZen**)
- // Further sensors from other sources (e.g. **ARPA** and/or **WiseAir** data about air quality)

// Interconnection | Industry

"A Building Information Model of the factory in order to rearrange the workplace according to the safety measures"

Sensors and Data Integration

- // Cameras to detect workers position through image-analysis
- // Temperature and humidity sensors to monitor air quality
- // BIM, a model of the facility

// Lessons learnt | Critical problems

Importance of system **extensibility** and **scalability** to add more features and sensors easily and economically

Value of **reusing already existing assets** and possibly newly installed ones in the future

Users **privacy** and **data management** is fundamental

Digital Twin as a representation and support for humans **not as a substitution of human knowledge**

The system **might be used non-ethically** not for good

Crowdsourcing and human-as-a sensor requires **solid users collaboration**

Merchants could reject the solution if perceived as a limitation for their business

Need of reaching a significantly high critical mass

Not considering also “non-measurable/measured data” might lead to **relevant approximations** and **unwanted gaps** between DT and reality

Thank you
